Oxidation of organic compounds. XII. Intermediate stages of catalytic oxidation of some monoalkylbenzenes in gas phase. S. R. Raukov, B. V. Suvorov, and A. V. Solomin. Kataliticheskaia obrabotka i oksidatsiia Akad. Nauk SSSR, Trudy Kont. 1955, 241-51; cf. C.A. 50, 1872a. Yield-temp. curves for various products of oxidation of alkylbenzenes are shown for air oxidation in the presence of mild V catalysts at 300-450° with 0.3-0.4 sec. contact time. MePh, EtPh and cumene were examd. The possible schemes of stepwise oxidation are shown. The possible oxidation products: AcPh, BzClO, BzH, BzOH, C₆H₆, PhOH, benzoquinone, and maleic anhydride were also subjected to oxidation. BzOH, maleic anhydride and quinone were found to be substantially stable. At temp. under 350° almost the only products are those of incomplete oxidation; at higher temp. these products decline in concn.; above 390° the oxidation is complete.

ORG: Vilnius State Pedagogical Institute (Vil'nyusskiy gosudarstvennyy pedagogicheskiy institut)

TITLE: Effect of the electric field on the photoluminescence of the ZnS-Pb crystal phosphor

SOURCE: AN LitSSR. Litovskiy fizicheskiy sbornik, v. 5, no. 2, 1965, 241-252

TOPIC TAGS: crystal phosphor, luminescence, electric field, electric effect, light excitation, photoluminescence, zinc sulfide, lead

ABSTRACT: The effect has been studied of direct and alternating electric fields on the photoluminescence of ZnS-Pb crystal phosphor with various lead concentrations. A flash of luminescence appeared in the phosphor when the electric field (Gudden-Pohl effect) was switched on and off. An alternating electric field has a quenching effect on the luminescence of crystal phosphor. The dependence of the quenching effect on the variation of the electric-field frequency, field strength, and temperature was examined. The existence of an

ACC NR: AT6012880

0

optimal time interval for the development of the flash of the Gudden-Pohl effect was determined. Flashing ignition luminescence for the crystal phosphor with the highest activator concentration was observed when the samples were affected by an alternating electric field during excitation. The authors thank students V. Yanushkevichyute and G. Ostasevichyute for carrying out measurements. Orig. art. has: 9 figures. [Based on author's abstract] [NT]

TEXT: This is information on the 22nd course of Zeiss organized at the House of Technology in Budapest. Good organization of the course is noted. It was attended by 120 Hungarians and 50 specialists, representatives of Socialist camp countries (Bulgaria, Poland, Rumania, the USSR). Lectures were read during the course on various problems of modern aerophotogrammetry and practical exercises were conducted. In the latter the students were acquainted with operations on stereophotogrammetric devices (multiplex, stereoautograph, stereo-planigraph, stereometrograph, coordinate meter) manufactured by the Zeiss plants at Jena.

On the Problem of Brittleness in Transformation Steels. V.
Rauner and M. Zozulova: (Hutnické Listy, 1956, 11, (3),
134-139). [in Czech]. Micrography, hardness tests, and
chemical analysis were used to study the bend-brittleness of
the sheet. Brittleness was found to be associated with the
precipitation of a hard intergranular constituent, which is
generally associated with a coarsening of the alpha-phase
grains. Highly brittle grains were found to have a higher
carbon and silicon content than the average obtained by
macro-analysis. Methods of rolling and heat-treatments
leading to brittleness, as well as those by which brittleness
is prevented were studied. --r. v.

Author : Rauner, Yu. L.

Title : Temperature regime of the ground layer of air in dependence upon the dimensions of the naturally moist portion

Periodical : Vest. Mosk. un., Ser. fizikom. i yest. nauk, 10, No 2, 151-159, Mar 1955

Abstract : One of the most important climate forming factors is the transformation (variation of principal properties) of air masses under the influence of the terrestrial surface (the so-called underlying air); and the study of the transformation of air masses is one of the most important and difficult problems of modern meteorology and climatology, a large amount of work being devoted to its solution. The investigation of the problem of the influence of the dimensions of an irrigated portion upon the meteorological regime in the ground layer was taken up by the Division of Climatology and Hydrology of the Institute of Geography, Academy of Sciences USSR, in 1951 in Central Asia and in 1951-1952 in the region between the Volga and the Urals. In the present article the author expounds certain results of the expeditionary operations of 1952, when only the influence of irrigation on temperature was studied. Seventeen references. He thanks Prof. B. P. Alisov.

 Nikolay, V. A. and Rauner, Yu. L., Rozy vetrov na snegu. [Wind roses on the snow.]
 Priroda, Moscow, 44(12):109-110, Dec. 1955. 2 figs. DLC. In the course of snow measure-
 ments in the "Black Lands" of Astrakhan and Stavropol Provinces in the late winter of 1954,
 the author observed thousands of three-pronged snow dunes similar to the tridactylous feet of
 giant birds. Each of the dunes had a clump of sod in the center protruding from under the
 snow from which rays up to 1-1.5 m long extended in S, SE, and SW directions. The uni-
 formity of direction of the rays was astonishing. A later analysis of meteorological data from
 the station "Putovoy" showed that from Dec. 1953 to Feb. 1954 north winds were predominant
 and all snowfall was connected with northerly winds. The author concludes that the orienta-
 tion of the rays of the three-pronged snow dunes reflected the character of winds and precipita-
 tion and that they should be considered as natural precipitation and wind roses. He points
 out that the local population uses them as natural compasses in their winter travels over the
 snow covered expanses. Subject headings: 1. Snow wind roses. 2. Astrakhan Region, U.S.S.R.

TITLE: Climatic evaluation of the results of microclimatic observations. (Klimatologicheskaya obrabotka rezul'tatov mikroklimaticheskikh nablyudeniy).

PERIODICAL: Izvestiya Akademii Nauk, Seriya Geofizicheskaya, 1957, No.2, pp. 258-264 (U.S.S.R.)

ABSTRACT: The article deals with certain problems relating to climatological evaluation of microclimatic investigations. Such observations are usually made during a short period of time (ten days, one month); as a result it is necessary to apply specific assumptions when evaluating results which must be utilized on a wider scale for practical purposes. A close statistical relation exists between the temperature of the air on a nonirrigated section and the microclimatic differences between dry and irrigated sections.

2

49 - 2 - 12/13

TITLE:

Climatic evaluation of the results of microclimatic observations. (Klimatologicheskaya obrabotka rezultatov mikroklimaticheskikh nablyudeniya).

Additional considerations indicate that such relations are linear for the entire range of the average daily temperature during the vegetation period. The air temperature, within a climatological period and the daily average, can be applied for reducing microclimatic series to average conditions over many years. By comparing the obtained average indices of the microclimatic differences with the thermal conditions of various rhumbs, it is possible to show the relation between microclimatic indices and the most typical conditions of circulation. Using the method described in the paper it was possible to obtain various characteristics and indices which are of considerable interest from the point of view of microclimatic differences.

TITLE: The Connection Between Wind Indicators and Some Forms of Sandy Relief in the Caspian Lowlands (Svyaz' mezhdu vetrovymi pokazatelyami i nekotorymi formami peschanogo rel'yefa Prikaspiyskoy nismennosti)

PERIODICAL: Izvestiya Akademii nauk SSSR - Seriya geograficheskaya, 1958, Nr 4, pp 64-68 (USSR)

ABSTRACT: The author describes and explains how the regular wind system influences the forms of the sandy Caspian lowlands. In this connection, the following scientists and their research work in this field are mentioned: F.F. Golynets, N.V. Bova, E.S. Lir, I.V. Nazarova, V.L. Leontyev, M.P. Petrov, T.F. Yakubov, I.P. Gerasimov, B.A. Fedorovich. There are 2 diagrams, 4 sets of graphs and 12 Soviet references.

TITLE: Some Results of Heat Balance Observations in a Deciduous Forest (Nekotoryye rezultaty teplobalansovykh nablyudeniyy v listvennom lesu)

PERIODICAL: Izvestiya Akademii nauk SSSR - Seriya geograficheskaya, 1958, Nr 5, pp 79-86 (USSR)

ABSTRACT: Information is given on the preliminary results of special gradient and actinometrical studies, carried out by the Zagorsk Climatic Detachment of the Institute of Geography AS USSR, within the IGY program, to investigate micro-meteorological conditions in deciduous forests. The performed calculations (described in detail) provided sufficiently accurate numerical values on turbulent heat and moisture flows above the forest and inside the forest cover. Recommendations are given as to methods to be applied in further observations. There are 5 sets of graphs, 1 table and 3 references, 2 of which are Soviet and 1 German.
